

Possible axioms of BDI logic

- $\text{GOAL}(\Box) \text{ BEL}(\Box)$
"belief-goal compatibility"
- $\text{INTEND}(\Box) \text{ GOAL}(\Box)$
"goal-intention compatibility"
- $\text{INTEND}(\text{does}(e)) \text{ does}(e)$
"intention leading to action"
- $\text{INTEND}(\Box) \text{ BEL}(\text{INTEND}(\Box))$
- $\text{GOAL}(\Box) \text{ BEL}(\text{GOAL}(\Box))$
- $\text{INTEND}(\Box) \text{ GOAL}(\text{INTEND}(\Box))$

106

How to get Belief-Goal Compatibility?

- Define a relation \triangleleft on worlds:
 $w'' \triangleleft w' \iff \text{fullpaths}(w'') \subseteq \text{fullpaths}(w')$
- B-G condition:
 $\Box w' \Box B(w, t) \Box w'' \Box G(w, t) : w'' \triangleleft w'$
- Under B-G condition it holds that:
 $\models \text{GOAL}(\Box) \text{ BEL}(\Box)$
for $\Box = \text{optional}(\Box)$

107

\triangleleft on worlds

108

B-G condition

109

B-G condition : example

110

Goal-Intention compatibility

- Goal-Intention compatibility is obtained in a similar fashion:
- G-I condition:
 $\Box w' \Box G(w, t) \Box w'' \Box I(w, t) : w'' \triangleleft w'$
- Under G-I condition it holds that:
 $\models \text{INTEND}(\Box) \text{ GOAL}(\Box)$
for $\Box = \text{optional}(\Box)$

111

B-G + G-I: intention is choice!

112

Possible axioms of BDI (ctd)

- $\text{done}(e) \quad \text{BEL}(\text{done}(e))$
"awareness of primitive events"
- $\text{INTEND}(\Box) \quad \text{inevitable}(\Box \rightarrow \neg \text{INTEND}(\Box))$
"no infinite deferral"
- $\text{INTEND}(\text{inevitable}(\Box))$
 $\text{inevitable}(\text{INTEND}(\text{inevitable}(\Box)) \cup \text{BEL}(\Box))$
"blindly committed agent"

113

Possible axioms of BDI (ctd)

- $\text{INTEND}(\text{inevitable}(\Box))$
 $\text{inevitable}(\text{INTEND}(\text{inevitable}(\Box)) \cup$
 $(\text{BEL}(\Box) \rightarrow \neg \text{BEL}(\text{optional}(\Box)))$
"single-minded committed agent"
- $\text{INTEND}(\text{inevitable}(\Box))$
 $\text{inevitable}(\text{INTEND}(\text{inevitable}(\Box)) \cup$
 $(\text{BEL}(\Box) \rightarrow \neg \text{GOAL}(\text{optional}(\Box))))$
"open minded committed agent"

The Little Nell Story (McDermott, Cohen & Levesque)

- problem: agent gives up too soon: it abandons its plan just because it believes it will be successful
- Cohen & Levesque: Little Nell problem occurs in *linear-time* variant of BDI logic satisfying the 'reasonable' principles that
 - (1) $\text{INTEND}(\Box) \quad \text{BEL}(\Box)$ ('confidence')
 - (2) $\text{BEL}(\Box) \quad \neg \text{INTEND}(\Box)$ ('drop full. intention')

$[\text{INTEND}(\Box) \rightarrow \text{BEL}(\Box)] \rightarrow [\text{BEL}(\Box) \rightarrow \neg \text{INTEND}(\Box)]$

115

Little Nell in BDI

■ In R&G's BDI logic this would be expressed roughly as:

- $\text{INTEND}(\text{inevitable}(\Box))$
 $\text{inevitable}(\text{INTEND}(\text{inevitable}(\Box)) \cup$
 $\text{BEL}(\text{optional}(\Box)))$
- i.e., since the agent believes that *there is a way* (by performing its plan) to eventually reaching the goal \Box , it drops its intention to perform the plan to achieve eventually \Box
- This property does not follow in BDI logic!

Ok!
